ATENCIÓN DOMICILIARIA AVANZADA: OPORTUNIDADES Y DESAFÍOS PARA LAS PRUEBAS EN EL LUGAR DE ATENCIÓN.

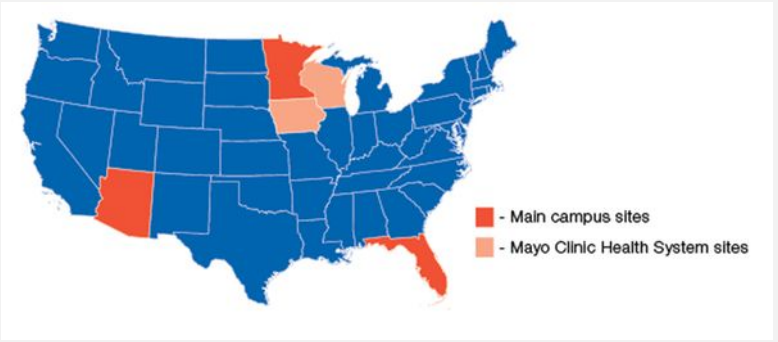
ADVANCED HOME CARE: OPPORTUNITIES AND CHALLENGES FOR POINT-OF-CARE TESTING.

RAVINDER SINGH, Mayo Clinic, USA

MAYO CLINIC PROVIDED COMPASSIONATE CARE FOR ABOUT 1.3 MILLION PATIENTS IN 2022

- Mayo Clinic cared for patients from every U.S. state and nearly 130 countries.
- Mayo Clinic cared for 6,700 international patients.
- Mayo Clinic had nearly 5 million outpatient visits and performed more than 141,000 surgeries.
- Mayo Clinic performed 1,858 solid organ transplants.
- Mayo Clinic conducted 515,665 telemedicine appointments.
- The number of patients served through Mayo Clinic remote care offerings, including Advanced Care at Home and Care Hotel, doubled in 2022 to more than 2,400.

MAYO CLINIC USA



- Mayo Clinic Hospital, Jacksonville, Florida: The hospital has 304 beds, but is expanding to 428 beds by 2026. The expansion will include 13 floors and 1.4 million square feet of space.
- Mayo Clinic Hospital, Methodist Campus, Rochester, Minnesota: This campus has 794 beds and 37 operating rooms.
- Mayo Clinic Hospital, Saint Marys Campus, Rochester, Minnesota: This campus has 1,265 beds, 70 operating rooms, and 10 intensive care units.
- Mayo Clinic Hospital, Phoenix, Arizona: This hospital has 353 staffed beds
- The Mayo Clinic Hospital – Rochester is a 2,059-bed teaching hospital located in Rochester, Minnesota.
- Mayo Clinic Hospital – Rochester is ranked first on the 2019–20 U.S. News & World Report Best Hospitals Honor Roll.

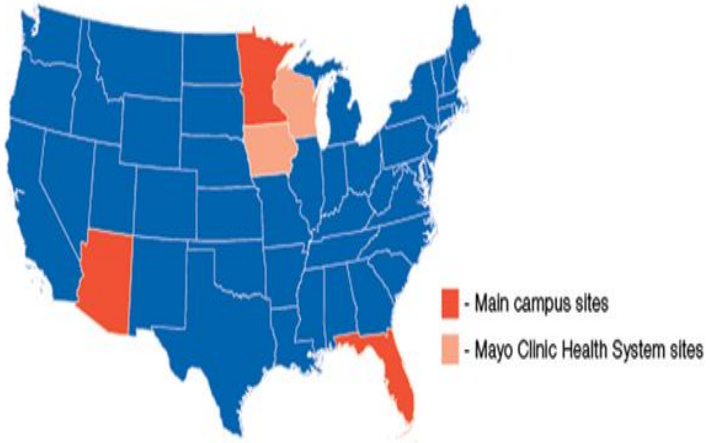
Implementation of a virtual and in-person hybrid hospital-at-home model in two geographically separate regions utilizing a single command center: a descriptive cohort study

Margaret R. Paulson[1], Eliza P. Shulman[2], Ajani N. Dunn[3], Jacey R. Fazio[3], Elizabeth B. Habermann[4], Gautam V. Matcha[5], Rozalina G. McCoy[4,6], Ricardo J. Pagan[5] and Michael J. Maniaci[5*]

We describe the implementation of Advanced Care at Home (ACH), Mayo Clinic's hybrid virtual and in person hospital-at-home model that combines a **single virtual physician-staffed command center** with in-home advanced practice provider visits and a vendor-mediated in-person medical supply chain that can deliver care in two diverse settings, urban and rural.



We hypothesize that the ACH model of hospital-at-home can use a centralized, single command center to coordinate and deliver inpatient-level care to high-acuity patients in two separate US regions while maintaining the high-level of safety and quality outcomes seen in previous hospital-at home models.

Paulson *et al. BMC Health Services Research (2023) 23:139*

Advancing Technology

Paulson ***et al. BMC Health Services Research (2022) xxxx***

1) Command Center:
Staffed with physicians, registered nurses (RNs), and advanced practice providers (APPs: nurse practitioners and physician assistants), who work alongside non-clinical service coordinators, linked together by technology to provide around-the-clock care to patients enrolled in the program across all sites.

2) Technology in the Home:
Custom technology kits, including biometric devices for monitoring vital signs (Bluetooth-connected sphygmomanometer, thermometer, pulse oximeter, and a floor scale), a custom-configured tablet with video visit capability, a telephone to facilitate 2-way communication, a backup power supply, a backup cellular communication cradle-point, and an emergency response system bracelet to keep patients and their families connected to the care team.

3) Care Delivery Services:
The model includes a full suite of care services, including APPs, community paramedics, RNs, aides, rehabilitative services, infusion therapy, phlebotomists, and basic radiography technicians dispatched to the patients' homes to allow for the provision of scheduled and acutely activated urgent patient care needs.

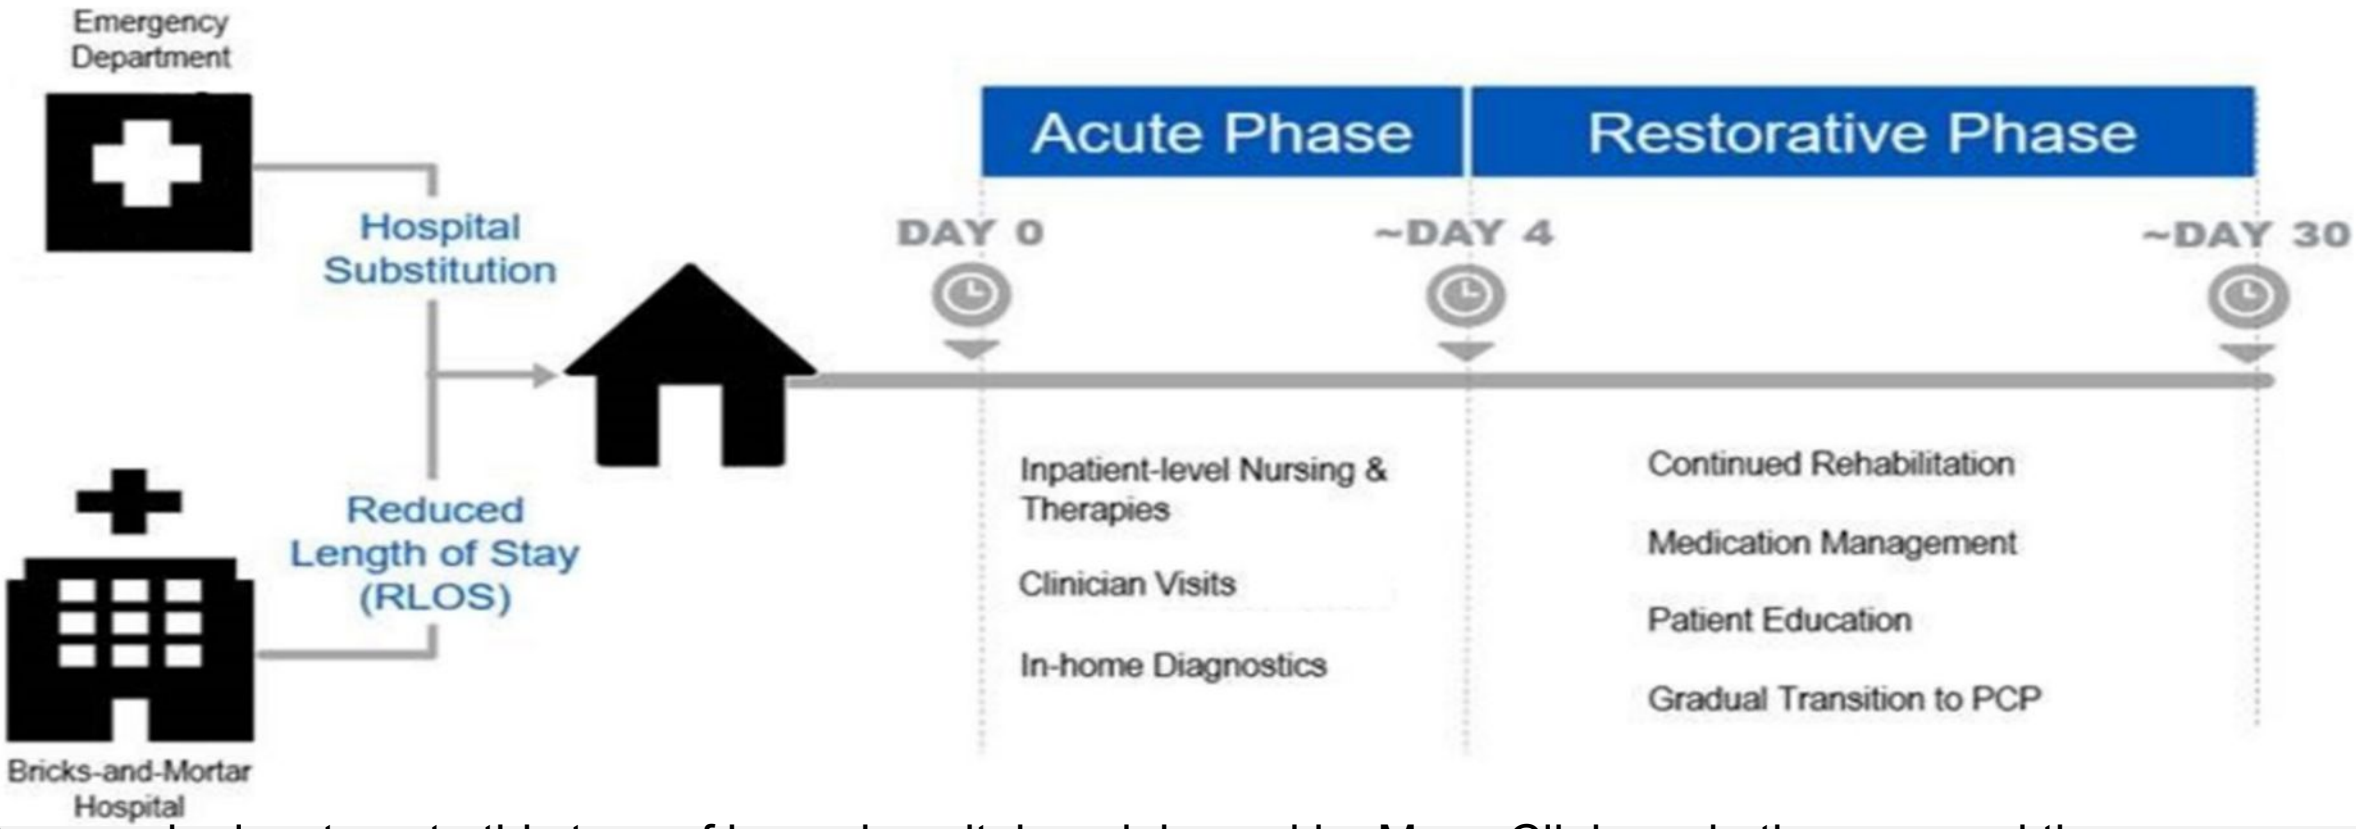
Paulson ***et al. BMC Health Services Research (2023) 23:139***



A second advantage to this type of home hospital model, used by Mayo Clinic and others around the country, is the ability to recruit **non-hospital owned resources** in the form of multiple community **medical vendors** and use them to physically deliver health care in the home.

This hub-and-spoke mechanism of the home hospital model used at Mayo Clinic promotes both safety and scalability.

The vendor-mediated in-person medical supply chain can be established separately from the central institution housing the command center, covering a much larger geographic area or even different cities, as seen in ACH.

Evaluation of the Enterprise Point-of-Care (EPOC) System for Blood Gas and Electrolyte Analysis

James H. Nichols, PhD, DABCC, FACB, Aparna Rajadhyaksha, MD, and Mirian Rodriguez, MA, LA

The EPOC blood analysis system consists of individual test cards (front and back of card in lower half of figure) that can provide blood gas and electrolyte analysis in multiple configurations. This configuration uses a card reader (upper left) that detects signals from the biosensor on the test card and transmits the data wirelessly to a handheld
PDA that contains the EPOC software to calculate analyte concentration from the raw card signals. Other configurations
allow the card reader to wirelessly connect to PCs or other hardware running the EPOC software.

TABLE 2. Total Precision of the EPOC System

	pH	P_{CO_2}	P_{O_2}	Na	K	iCa	Hct
Level 1							
Mean	6.992	86.2	74.9	113.4	2.15	2.18	23.8
SD (% CV)	0.0107 (0.15)	2.4 (2.8)	2.8 (3.8)	1.2 (1.0)	0.03 (1.5)	0.04 (1.7)	0.7 (2.9)
Level 2							
Mean	7.673	24.1	140.1	153.1	6.71	0.662	45.0
SD (% CV)	0.0108 (0.14)	0.7 (3.1)	2.8 (2.0)	1.6 (1.0)	0.07 (1.1)	0.01 (1.9)	0.8 (1.8)

Total precision was conducted at Epocal during the pilot manufacturing stage. Two levels of controls (Mission Diagnostics) were analyzed for each batch of test cards using up to 6 card readers. Over a 2-month period, 20 different test card lots were evaluated with 16 card readers. Hematocrit was performed using 2 levels of Hct control (Mission Diagnostics) at Baystate Health and was performed on 2 card readers using 6 different test card lots.

TABLE 3. Correlation Statistics Between the EPOC System and i-STAT

	pH	P_{CO_2}, mm Hg	P_{O_2}, mm Hg	Na, mmol/L	K, mmol/L	iCa, mmol/L	Hct, %

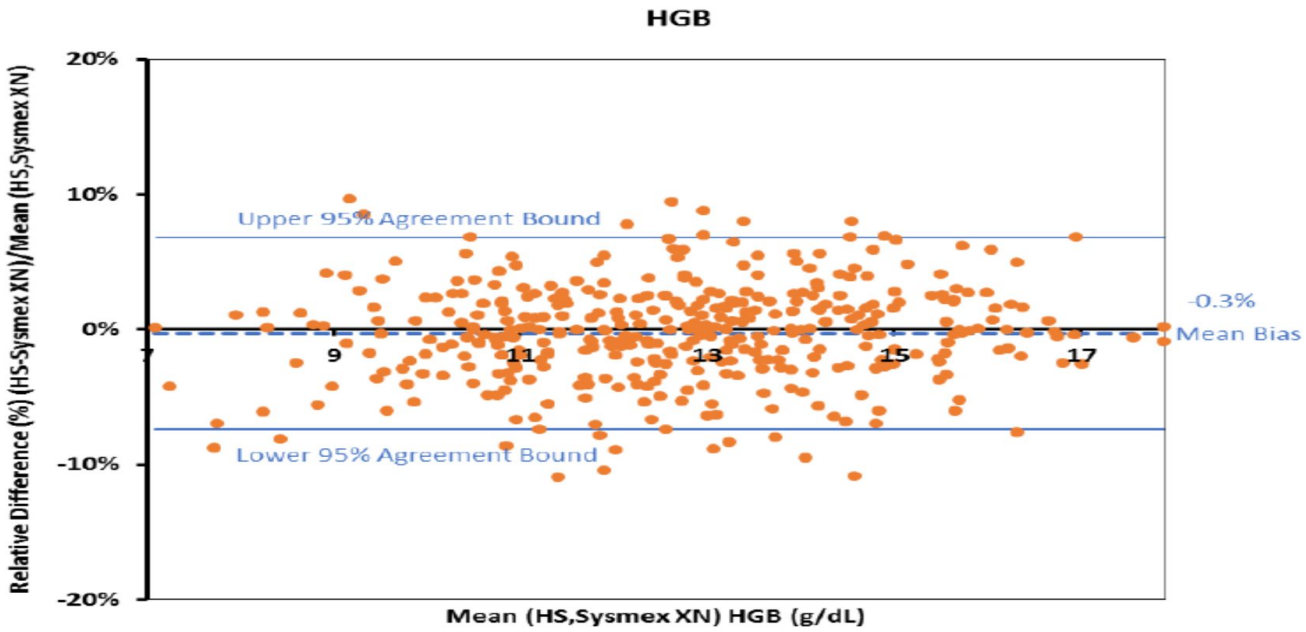
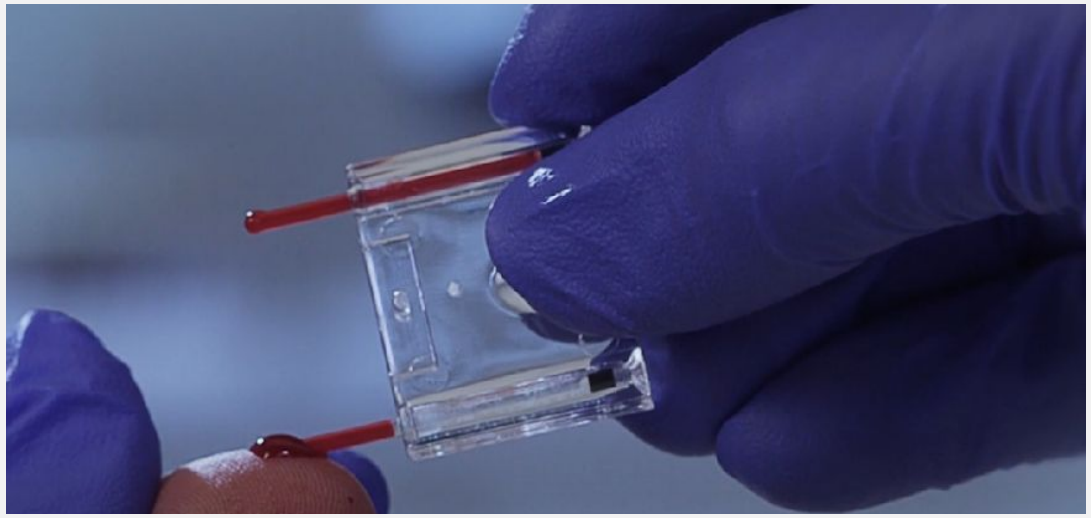
SPECIAL REPORT

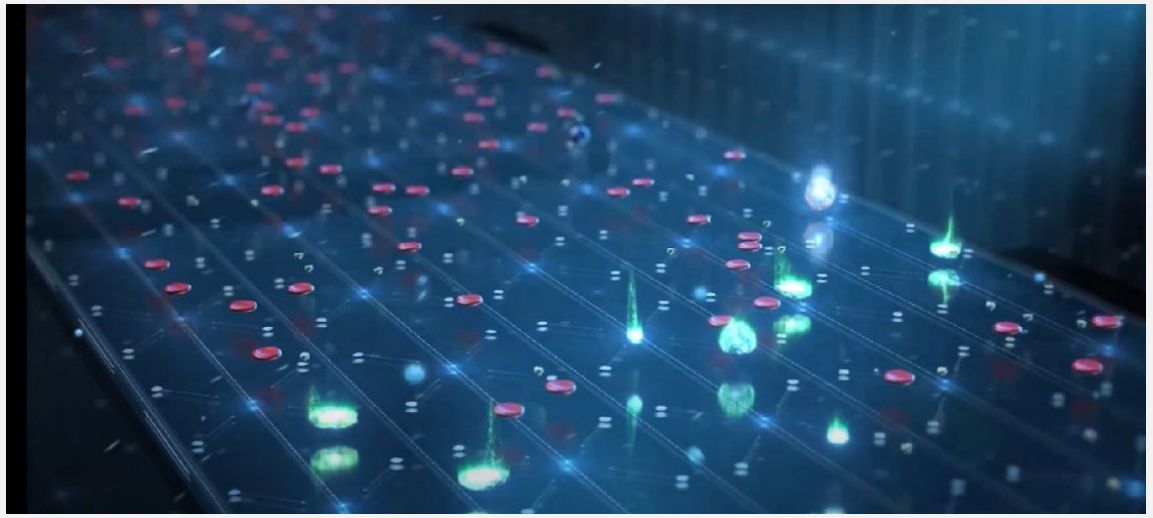
A Novel Approach to Hematology Testing at the Point of Care

Avishay Bransky, [a]Anders Larsson,[b] Elisabeth Aardal,[c,d] Yaara Ben-Yosef,[a,*] and Robert H. Christenson[e]

Summary: The HemoScreen analyzer demonstrates lab equivalent performance, tested at different clinical settings and sample characteristics, and might outperform standard techniques in the presence of certain interferences.
This new approach to hematology testing has great potential to improve quality of care in a variety of
settings.







1. Microfluidic viscoelastic focusing 2. Lab-on-a-Cartridge 3. Machine vision and AI

HemoScreen cartridge accepts a disposable dispenser that acquires two minute blood samples

Reference method (Spun HCT)	Sysmex XN	HemoScreen
The sample is centrifuged and the ratio of packed cells' volume to whole blood volume is calculated	Direct Current, electric pulse: cell volume is measured based on electric impedance divided by estimated serum volume.	Cell volume is directly measurement from image. HCT is attained from MCV and RBC product
$HCT_{ref} = X/(X+Y)$ X,Y - lengths JALM | 532–542 | 6:2 | 2021	$MCV_{XN} = k\sum_{i=1}^{n}\frac{P}{n}$ P — pulse height n — number of cells k — empiric factor $HCT_{XN} = k\sum_{i=1}^{n}\frac{P}{v}$ v — est. volume	$MCV_{HS} = \sum_{i=1}^{n}\frac{V_i}{n}$ V — cell volume n — number of cells $HCT_{HS} = MCV_{HS} * RBC$ 		Result depends on cell volume distribution and not only on distribution mean.	Indirect measurement, depends on cell electric properties and other factors	Direct measurement of MCV from image. HCT is based on the actual volume of cells without empty spaces in between cells

Compared a point-of-care HemoScreen hematology analyzer to an automated Sysmex XN analyzer for complete blood count (CBC) and white blood cell (WBC) differential, and evaluated its capacity to detect leukocyte abnormalities.
A total of 100 K2-EDTA whole blood samples, median age 56 years (2 months to 92 years), were compared.
For CBC and WBC differential we compared 74 samples with no confirmed abnormal leukocytes.
For 26 samples both analyzers gave flagging regarding leukocytes and the accuracy of the flagging was compared. Abnormal leukocytes were confirmed with manual microscopy (200 cells).

Analytical Performance Evaluation of Three Point-of-Care CBC Analyzers for Management of Clozapine Therapy in Ambulatory Psychiatry Clinics

Robert D. Maynard,[a] Tony Funk,[b] William Harrill,[b] Jenny Jin,[b] Dawn Smith,[b] Gina Smith,[b] and Nichole Korpi-Steiner [a,*]

Neutropenia — Potentially life-threatening agranulocytosis led to restrictions on clozapine's use in many countries, but neutrophil monitoring has allowed for safer use of the medication. The US Food and Drug Administration requires patients in the United States to have a minimum absolute neutrophil count (ANC) greater than or equal to 1.5 × 10^9/L to initiate clozapine.

Table 1. Imprecision of CBC with differential parameters.

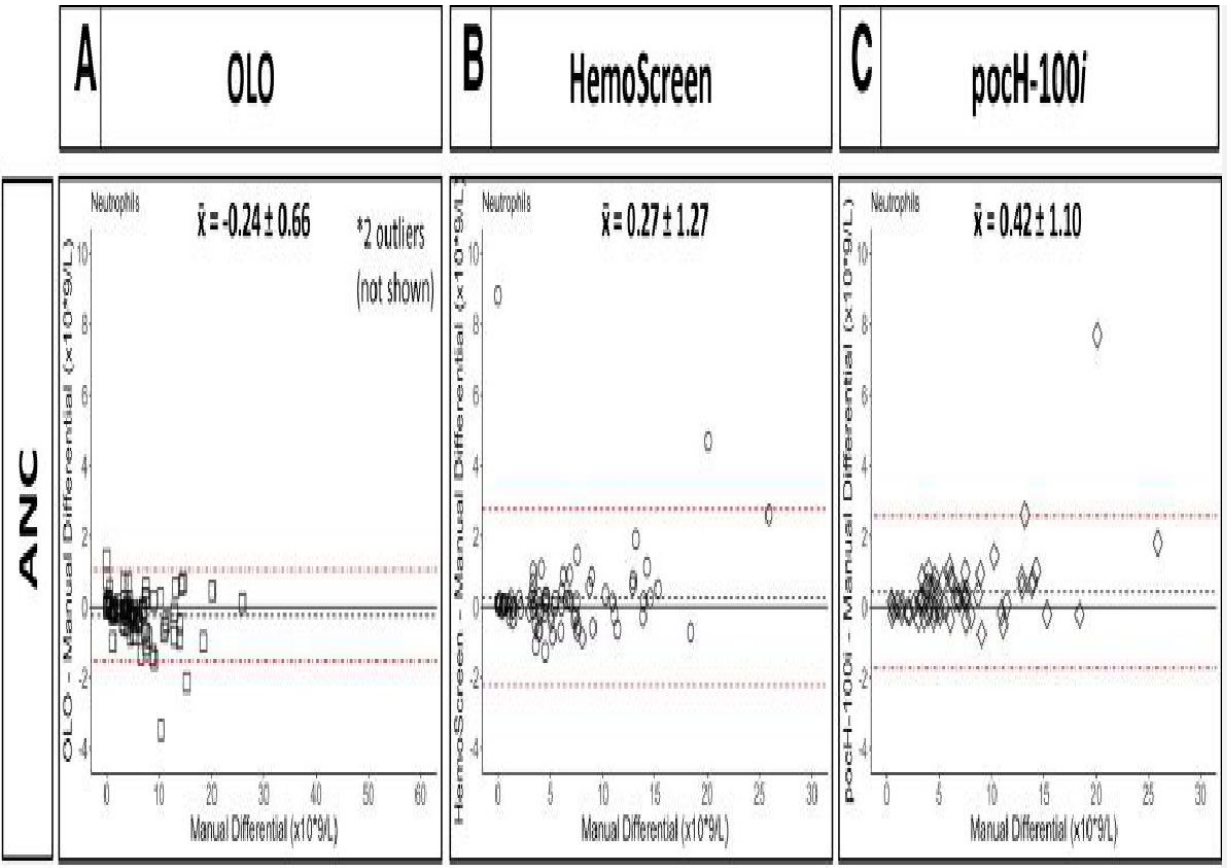
Analytical Performance Evaluation of Three Point-of-Care CBC Analyzers for Management of Clozapine Therapy in Ambulatory Psychiatry Clinics

Robert D. Maynard,[a] Tony Funk,[b] William Harrill,[b] Jenny Jin,[b] Dawn Smith,[b] Gina Smith,[b] and Nichole Korpi-Steiner [a,*]



Results: For CBC parameters, a CV ≤ 6.4% was observed on the OLO, CV ≤ 6.2% for the HemoScreen, and CV ≤ 5.1% with the pocH-100i.
Each device accurately identified ANC with the greatest mean bias ±0.42 × 10^9/L using the pocH-100i vs manual differential.
For results near the medical decision points (ANC <1.5 × 10^9/L), clinical concordance of ANC results was 55.6% for the OLO, 89.5% for the HemoScreen, and 82.4% for the pocH-100i.
Conclusions: The HemoScreen device demonstrated the best clinical concordance in ANC values at medical decision thresholds for clozapine therapy management.

CBC parameters as biomarkers of Sepsis

Pros

- Rapid turn-around time;
- Easy to perform;
- Available in all laboratories;
- Low cost;
- Easily available to Clinicians

Cons

- They are not specific for sepsis;
- Do not provide information on the etiology of sepsis;
- Their values can be influenced by several clinial conditions.

Point-of-care testing for sepsis in remote Australia and for First Nations peoples

setting, it is within these remote primary care facilities that tools for the early detection and treatment of sepsis have the greatest potential to provide benefit.

The Australian Government has funded a team of investigators, via the Medical Research Future Fund's (MRFF) Primary Health Care Research initiative, to collaboratively test whether using a FBC point-of-care testing device (HemoScreen, PixCell Medical Technologies) can build on the substantial point-of-care testing expertise within remote NT primary care centers and its workforce, with the aim to improve sepsis detection in a cost-effective and culturally appropriate way. The team will embed the WCC and platelet count biomarkers into existing primary care sepsis pathways. In addition to sepsis, the FBC test, or subsets thereof, form key components

Implementation of Point-of-Care Testing in an Ambulatory Practice of an Academic Medical Center

J. Benjamin Crocker, MD,[1,3] Elizabeth Lee-Lewandrowski, PhD, MPH,[2,3] Nicole Lewandrowski,[1] Jason Baron, MD,[2,3] Kimberly Gregory, MT(ASCP),[2] and Kent Lewandrowski, MD[2,3]

From the Departments of [1]Medicine and [2]Pathology, Massachusetts General Hospital, Boston, and [3]Harvard Medical School, Boston, MA.

Key Words: Point-of-care testing; Practice efficiency; Cost-effectiveness; Primary care; Hemoglobin A_{1c}; Lipid panel; Comprehensive metabolic panel

Am J Clin Pathol November 2014;142:640-646

Results: Following implementation of POCT, there was a 21% decrease in tests ordered per patient (P < .0001); a decrease in follow-up phone calls and letters by 89% and 85%, respectively (P < .0001 and P < .0001); and a 61% decrease in patient revisits (P = .0002). Estimated testing revenues exceeded expenses by $6.62 per patient, and potential cost savings from improved efficiency were $24.64
per patient.
Conclusions: POCT can significantly improve clinical operations with cost reductions through improved practice efficiency.

Diagnostic & Medical Laboratories in the US industry analysis

Services provided by diagnostic and medical laboratories play a crucial role in patients' medical evaluations and treatment, with the data collected by laboratories benefiting the broader healthcare market, giving healthcare practitioners insights into the onset, severity and causes of patients' ailments and illnesses. The aging population and the preventive medicine movement are pivotal factors propelling the increased need for laboratory services. For instance, the increasing number of elderly patients undergoing preventive screening tests has increased demand, particularly to address irregular screening results. 2020 witnessed a surge in demand for testing services due to COVID-19, necessitating increased government funding for laboratories. This resulted in a 2020 spike in revenue, contributing to strong performance over the past five years, with industry revenue growing at a CAGR of 5.3% to reach $85.8 billion, experiencing a 2.5% increase in 2023 alone.

TRENDS AND INSIGHTS :

- **Advances in medical technologies have posed a competitive threat to laboratories.** Point-of-care testing has allowed hospitals to perform their own tests, avoiding medical laboratories.
- **The clinical pathology service market has expanded.** This results from its crucial role in interpreting patients' clinical data and diagnosing and classifying their conditions.
- **Diagnostic and medical laboratories are often found near healthcare facilities.** This is mainly so these hospitals and doctors' offices can easily refer their patients for lab work.
- **Price competition in medical laboratories is intense.** This drives consolidation as larger laboratories can better take advantage of low costs due to economies of scale and meet competitive market prices.

Sysmex pocH-100*i*™ Automated Hematology Analyzer

Hematology Testing Made Easy

The pocH-100*i* hematology analyzer, designed for laboratories testing up to 25 samples per day, has the smallest footprint of any hematology analyzer on the market. Requiring only 15 µL of EDTA whole blood for reporting 17 clinical parameters with a 3-part WBC Differential, it includes an Absolute Neutrophil Count (ANC). Quality processes are addressed with the pocH-100*i* closed tube sampling and simple reagent system. Six on-board QC files support assurance of instrument performance. The intuitive push button menu simplifies the operation of this analyzer.

Customers located in Canada: Product availability may be different from the U.S.. Please call Sales at 1-866-779-7639 for more information.

Features and Benefits | Specifications | Technology | Complementary Applications

Compact, Accurate and Intuitive

- Small footprint fits easily on a laboratory bench or table
- Closed tube patient and QC sampling
- Only two reagents for complete results
- Same direct current detection method as Sysmex high-end systems to provide accurate, comparable results
- Minimal training required
- Simple menus
- Push button technology with auto start up and shut down
- Non-toxic, biodegradable reagents

Dr. Brad Karon, Mayo Clinic;
I am not familiar with Hemoscreen. The devices generally fall into two buckets.
Those like OLO that use digital imaging to take a picture of cells and perform count and differential, and those like Sysmex poC-Hi that are conventional cell counters made smaller and simpler for use at POC.
I am not convinced that technologies using digital imaging will achieve required specificity and precision at defined cut-offs as noted by 55% concordance in the clozapine paper.
Keep in mind these patients may have low neutrophil counts but normal cell populations. Throw in abnormal cell populations like you will see in oncology patients and I suspect performance will be even worse.
The miniature conventional cell counters like poc-Hi might be reasonable to try. poc-Hi in particular is waived but approved only for otherwise healthy outpatients, use on label is contraindicated in anyone with cancer diagnosis.
So you would be using off-label but as long as it flags for abnormal cell populations like other cell counters do so you can reflex to other lab method should be OK.
We use a poc-Hi in our high consequence infectious disease lab and seems to correlate well with other Sysmex devices so might want to look at that.
